ABSTRACT

A fluorescent conversion medium (1) including: fluorescent particles (12) comprising semiconductor nanocrystals, the particles absorbing visible light to emit fluorescence of a different wavelength, a transparent medium (11) holding the fluorescent particles dispersed therein, and satisfying $0.4 < C \cdot d/r^3 < 5.0$ wherein r is the average diameter (unit: nm) of the fluorescent particles (12), d is the film thickness (unit: μ m) of the fluorescent conversion medium (1), and C is the volume ratio (unit: vol%) of the fluorescent particles (12) to the fluorescent conversion medium.
